Milkweeds (Asclepias spp.) are herbaceous perennial plants named for their milky sap. These plants occur in a wide range of habitats, including intact natural communities on roadsides and highly disturbed roadsides. As required host plants for monarch (Danaus plexippus) caterpillars, milkweeds play an essential role in the butterfly’s life cycle (see reverse). Vegetation management that allows milkweeds to persist can support monarchs. This guide can help you recognize the most common native species found on roadsides in your region.

The most common milkweeds in roadsides in Kansas & Missouri (in alphabetical order):

Swamp milkweed (A. incarnata)

**PLANT:** One to many upright, branched stems; smooth or with short hairs.  
**LEAVES:** Opposite; lance-shaped or narrow; with few short hairs.  
**HABITAT:** Moist prairies, marshes, ditches, edges of ponds, lakes, streams.  
**SOILS:** Silty to loamy or clayey; moist–wet, tolerates some mesic.  
**BLOOM:** Jun–Aug; light to dark pink or rose purple.

Common milkweed (A. syriaca)

**PLANT:** One to many stout, upright, unbranched stems; usually with short dense hairs.  
**LEAVES:** Opposite; oval-shaped; hairy underneath.  
**HABITAT:** Prairies, old fields, railways, open woods, flood plains, disturbed areas.  
**SOILS:** Sandy to loamy, clayey or rocky; dry–wet.  
**BLOOM:** May–Aug; pink.

Butterfly milkweed (A. tuberosa)

**PLANT:** One to many spreading to upright stems; with short hairs; lacks milky sap.  
**LEAVES:** Alternate; lance-shaped; hairy underneath.  
**HABITAT:** Prairies, old fields, glades, open woods.  
**SOILS:** Sandy, loamy, rocky; dry–mesic.  
**BLOOM:** May–Sep; orange to red or yellow.

Whorled milkweed (A. verticillata)

**PLANT:** One to several upright, unbranched stems; with short hairs.  
**LEAVES:** Whorled; narrow to needle-like; smooth or with short hairs.  
**HABITAT:** Prairies, open woods, fields, flood plains, glades, railways, disturbed areas.  
**SOILS:** Sandy, rocky, clayey; dry–mesic.  
**BLOOM:** May–Sep; white to green.

Most common milkweed species continued

Green antelopehorn (A. viridis)

PLANT: Multiple upright, unbranched stems; usually smooth. LEAVES: Alternate; lance- to oval-shaped; with wavy margins. HABITAT: Upland prairies, disturbed areas. SOILS: Sandy, rocky, clayey; dry. BLOOM: May-Jul; green with touches of purple.

THE MONARCH BUTTERFLY LIFE CYCLE

Multiple generations of monarchs are produced over the spring and summer, with the fall generation migrating to overwintering sites. You can monitor monarchs or milkweeds; see Additional Resources above.

Additional milkweeds in Kansas and/or Missouri:

Maps & Distribution Data:
These profiles are derived from regional floras and field guides and Woodson’s The North American Species of Asclepias (1954). Most common species are abundant across both states and are found in roadsides. Less common species might not occur in both states, have a limited distribution across a state, or may be less common in roadsides. Additional species may be uncommon in roadsides, have a small distribution in a state, or are uncommon or rare. The range maps indicate counties where species have been observed (but may be incomplete), and were created by USDA-NRCS using the latest data from the USDA’s PLANTS database (https://plants.sc.egov.usda.gov).
